Dear Mr. Bray:

Regarding your query about me walking across the top of the mother ship while it was hovering out in Space. This is exactly what happened.

Earlier in the book INSIDE THE SPACE SHIPS, you read how the ships of other planets create an artificial atmosphere around themselves. You also read that they can control this as to density and distance from their ships. They have studied the law and workings of nature and their ships are actually small planets.

In reality as we live and move on the Earth, we are moving on the outside, or top, of a large natural space ship, which is moving through Space at the rate of 162 miles per second on its orbital path around the sun, while at the same time it revolves on its axis at the rate of 18 $\frac{1}{2}$ miles per second. This is a tremendous speed, yet we are not aware of it.

True, if the Earth were to stop its movements and hover in Space as the ship was doing, we would all fall off and the planet itself would explode because it would have no atmospheric pressure to keep it compressed.

For atmosphere is merely nothing but the stirring up of space as the planet moves through space and the planet has no way of artificially creating atmosphere. But the Space ships humanly controlled by those who have an understanding of the Law, do have artificial atmospheric conditions created around them.

There is much in space about which we are totally ignorant that we, too, will learn as time passes and we learn to build ships that can travel through space as our neighbors on other planets are doing.

With every good wish to you.

Very sincerely,

Geo Adamski
