

were said to have occurred between 11 P.M. and 1.30 A.M.

Witnesses reported that a bright light would suddenly flash for 3 to 4 seconds about 20 feet above the ground. No other unnatural lights were noticed in the sky which was generally clear on the nights that the lights were observed. Two witnesses in a car believed that they heard a sound like a car motor before the light was observed.

The technologist reported that grain and grass were flattened in patches where the light appeared in circles of approximately 5 feet diameter. In one field, 8 to 10 of these flattened areas were found. No footprints or other signs were seen around the flattened areas. In another area where a light was seen, cattail stalks were broken or bent some 6 to 8 inches above the ground. The technologist who reported this information could not duplicate the type of break in the stalks by pushing from the sides and believes that the necessary force ~~it~~ would have to come from above the cattails.

I don't know what to make of these sightings but perhaps you might have additional information which would explain them. I hope that these two reports will be of interest to you.

Yours sincerely

J. K. Shikes
