

The reason I feel strongly on this matter is because of the major impact it will have on our entire civilization if the author is correct in his facts and theories. If he is correct, it means the greatest knowledge breakthrough in the history of Man has already been made without the public being aware of it. Should the author be wrong, we should know this also.

This matter is not a question of some minor advance in science or engineering that would have only small effect on society and could therefore be deferred because of a lack of resources to conduct extensive and perhaps very costly research. As already emphasized, if the author is correct, it represents the greatest knowledge breakthrough in history, and not only in the scientific field.

I trust you will now understand why I am perturbed at the lack of interest displayed by NRC to date, but in particular by its attitude, which is hardly scientific. All I ask is that the book be read and if the contents are basically correct, then say so. If not correct, then it should be a simple matter for NRC to explain clearly and factually just how and why it is incorrect. Now, please, let's get on with it.

I look forward to an early reply.

Yours sincerely,

Arthur Bray
