

Judging from earlier analyses, it appeared obvious that the metal had a very high manganese content, but from this and other metal components listed in the analyses, he was inclined to think that the hardware was a foundry product because metals of this nature are to be found and are manufactured in the Quebec area. However, he would hold final judgment until after he had carried out a thorough analysis of the metal. He said he would inform me when they were ready to carry out such work.

In the meantime, Dr. Smith asked to be advised of any further developments concerning the metal, should they arise, and also fuller ^{data} ~~details~~ of the background details of the recent test carried out in Montreal by R. Chamberland.
