

Post Office Box 51
City View, Ontario
February 7, 1955

Dear Harry,

Thanks a lot for your two recent letters. They caught up on me before I had a chance to answer them. I was very much intrigued by the Dick Miller story. Points in it check very well with data which I have received from other sources, which I am sure neither Mr. Miller or any in your group know anything about.

There is one point which I think we all should bear in mind at all times when assessing these communications. I am convinced that the majority of them are genuine, but subject to a fundamental lack of precision in semantics. By this I mean that most of the people from other worlds use direct thought communication, which in itself is quite precise, but when they have anything to do with us they must work through a language. Consequently, although they appear to have a pretty good knowledge of the language, close examination brings out the fact that they frequently have pretty weird ideas about the meanings of some of our words. For example; one group with whom I was conversing used words entirely in their literary sense. We were discussing mathematics, I asked about their number scale which was 10 like ours, since they also have 10 fingers. I asked the difference between seven and three, and was told that there was no difference since they were both numbers! I asked when one subtracted three from seven how much was left and was told, nothing, since when one subtracts it is all gone! Further questioning brought forth the fact that their mathematics is operational and not equivalent as ours is. But this goes to show how careful one must be with the values of words.

I noticed several places in Dick Miller's story where words have rather obviously been carelessly used. Of course, I do not know where in the circuit the distortion entered but I strongly suspected the space people in their use of an alien means of communication. I refer particularly to the reference to cosmic rays. I do not think that was what was meant at all, but that the earth is moving into a region where strong electric, magnetic and time fields exist. A purely secondary consequence would be an apparent increase in cosmic ray count.

I was much interested in the photo cell and light beam experiment, and if I can find time I propose to play with it. It is a straight forward circuit and I should have no trouble with it. If I can get around to it and get anything interesting I shall let you know. However, from what I know of these people's technology I don't think any circuit is immune and I am quite sure that they can climb onto any circuit we have.

I am very interested in the book you mentioned and if a copy is still available I would like it. If available let me know the amount and I will send it along.

One thing which I would like to check thoroughly is the identity of all the various space people, where they are from and some of their objects hereabouts. I am deliberately keeping you in the dark with regard to my other contacts so I can work this phase of the check. Could you find out from your various contacts the names of as many space people as possible, and the names and objects of their various projects, and also if they know corresponding particulars of other space people and projects. What I hope to do is to find the same group of people making contact at two or more places not related. So far I have been able to get a few check points but not nearly as many as I would like to have. It would appear that each group works hard to establish a contact and then rests on their laurels thereafter. It doesn't make too much sense.

In a general sense, these are the points I feel are fairly well established. Space people from a number of alien planets are in the vicinity of the earth. Physically, they resemble us quite closely, and are probably of the same basic human stock. Something is about to happen which will be quite serious for the human race on this earth, and probably will have serious repercussions throughout the solar system. The space people intend to minimize the damage and ensure that our race does not perish. That we are rather primitive compared with other races, and under normal circumstances would be left to our own devices to grow up as best we could, but because of some impending crisis, they must now interfere in our affairs, but they intend to keep such interference to an absolute minimum. Beyond this I feel we have little but conjecture to go on and I want to extend our information as far as possible by the cross check method which I proposed above. As I suppose you have gathered, I do not have too much confidence in the detail given by any one contact for the semantic reasons given.

There is one other point on which I am convinced, and that is that these people cannot give us any of their technology unless we are prepared to work it out from scratch. They might give us hints and clues, and confirm when we are on the right track, but I think outright instruction is out, mainly because of semantics.

This is all for the present. I shall write again soon, and I am looking forward to further information on your contacts

Yours truly

W.B. Smith

January 27th 1955

Dear Wilbur:

Am I presuming too much in addressing you by your first name. I do not care very much for formality, knowing that the English are very strong for it. I have hesitated a long time before doing it.

Mr Lewis from whom I purchase my books on "Saucers" called me on the Phone and said he had a book worth while reading. Had just recd a few and that they were selling very rapidly. Looked them over and bought two at three dollars and fifteen cents each.

They are written by a Leonard Cramp and published in London. The name of the book is, Space Gravity & The Flying Saucer. He approaches the subject from quite a technical angle and to substantiate his theory has incorporated a number of very fine engravings of a Saucer showing it in sectional view. I have just begun to read it and it to my mind he seems to have shown several angles that might be worth something to you. Of course you may be away ahead of him and I have no doubt you are. If you feel it sounds as tho you could use one I will mail it to you. Otherwise I shall let one of my friends here have it. Let me have an Air Mail answer.

In constructing a Beam Receiver according to the Sketch I sent you I have found that whoever put it out neglected to include some very important items. One in particular and that was the concentration of the light as recd and directed on the Cell. Can you help me out on this as well as the Transmitter. Keeping costs down to earth. Want to get this in the mail so with best wishes. I remain.

Sincerely

Harry

Jan 15th 1954

Dear Wilbur:

Hope you will pardon the liberty I am taking in calling you by your first name. None of my acquaintances ever call me by anything else and I do not like being formal.

Time seems to be the main topic among the thinkers and your few thots as you expressed them were recieved with approval when I read portions of your letter. Namely Dorsey and Meyers. They as you may surmise are very close to me in all of our work. Harry Meyers is with the L.A. County Board of Education in a high executive position and Dorsey has his own business. Are past middle age and very likeable.

The following may be of interest to you or you may have heard some of it previously. Let me know. This is going to be quite a chore as I am not a very adept individual with the typewriter. Before going into the meat of the letter I will insert a few thots. If you establish a station in New Mexico could you drop in on us here for a few days. I am sure the time will be well spent. Or perhaps I could run you down there, that is, if I would not interfere with the work. I would like to have you meet Cy Newton who is acknowledged to be the best man in America on Magnetic fields and Vortexes. He has also developed a very fine locator that functions at unbelievable distances. Is a very good friend of Gene Dorseys.

Hope you heard from Dr Humason. Since writing I have heard him quoted as not knowing of the Asteroids. This may not be true tho. I am sending you a rough sketch of the Light Beam hook up. This is all I can get at this time, and is not the Trans end. Can you give me a complete one. Do not feel financially able to go into an expensive setup.

I did not quite understand what you mentioned about The Bad Lot. Did you mean those at North Bay. Are they Canadians or Outer Space. If from Canada, Gov could keep them in line. Thanks for your letter. It was very interesting. Lets have more.

Now for the main angle, Harry Meyers with his wife and myself and wife went out to the desert a couple of weeks ago. To the Giant Rock to be exact. There we met Williamson, who was with Adamski at time of his contact. Dan Fry and a chap by the name of Dick Miller. Williamson and Miller had just arrived from Detroit. Miller, whom I will call Dick has had a contact at or near Detroit and the meeting was for the purpose of getting our opinion as to whether his story was acceptable and boni fide. I will say here that we all agreed it was the most interesting and descriptive and seemingly true story we had ever heard.

Dick is a Tech, and Radio expert, about twenty five years of age. Very modest and unassuming. Tells his story very well.

A few months ago, he with three associates were working in their shop in Detroit. Knowing that the Gov would not grant a licence for Transmitting they rigged up a Light beam setup. Hooked in a Tape outfit and kept it on twenty four hours a day. On this particular day, Sunday Dick was in the shop doing some work, when he heard the hum of a tune in. In about fifteen minutes a voice spoke saying Hello Dick, you have been wanting a contact. Go to (Blank location and wait and we will be with you. This location was about forty miles from Detroit. Dick left word and gave location for the other fellows and went out. Arrived, parked his car and waited. In about fifteen minutes he became a bit anxious and decided to go up a small hill and down into a basin which he had previously noted. It was away from the road and well hidden. In climbing the hill he looked up and saw at a high altitude a speck which was rapidly descending. Before he could grasp what it was, the object was down and into the basin. It

Harry M. Gesner

4815 TOPEKA DRIVE
TARZANA, CALIFORNIA

was a large sized Saucer hovering about five feet above the ground. When he arrived he saw that a door was open just below the rim and a ramp had been let down. At the top stood a figure who motioned him to enter. This he did and without a word being spoken the man motioned him to follow. He was then led around a sort of hall or passageway which had several doors leading off on the inside. The man stopped at one and they went into the main part of the ship. The doors seemingly led into storage, apparatus, living quarters etc. The ship was about one hundred and fifty feet in diameter and the inside room about eighty feet diameter and forty feet high. In the center of the room there was a desk approximately six feet in diameter with a man seated with several push buttons and papers in front of him. The man had his back to Dick and did not pay any attention for several minutes. He then arose, turned to Dick and said that he welcomed him. Dick extended his hand to shake and the fellow by passing his hand and put his own on Dick's shoulder giving it a slight shake. He smiled and told Dick they had listened to him for some time and knew all about him. He later found that they could read his thoughts. (This is not unusual). That he wished to welcome him. While Dick was awaiting recognition he had time to survey the ship. The unusual size made it easy for installations. There were several large panels which seemed to have many controls similar to Electronic ones. The one that attracted his attention most was the one that had what appeared to be six three feet by three feet ground glass panels with controls below each one. None on this later. There were a crew of five people who were dressed in the suits similar to Service Station attendants but each one of a different color. Soldek the Commander gave his name and said that they were each from a different Planet and each followed a different vocation. Soldek was a bit above medium height slightly darker than we and the others varied in color. All were extremely good looking. Soldek resembled Clark Gable very much in build and looks except that he had no mustache. All had medium crew cuts with dark hair. Oh yes. The chair at the desk was outstanding. It had a yoke at the top of a small column and adjusted itself according to the weight of the occupant. The seat swiveled both horizontally and forward and backward. Was extremely comfortable. We might copy it. Soldek used perfect English said he came from Mars but evaded answering any questions regarding the ship and its functioning. Confined his talk mostly to things in general. Said that we are now entering what they called a Cosmic pocket where there was a very dangerous concentration of Cosmic Rays and that the other Planets were shielding us as much as possible, but that not entirely. This was impossible. A Professor from Cornell was there and told us that from a count of thirty a couple of years ago it had now jumped to three hundred. A near dangerous number. Soldek told him that they knew all about Russia, its experiments and that they had nullified and made a dud of a bomb they had tried to explode some time ago. That they had assembled one from materials or elements they did not know how they would react. That they just wanted to see the effect. If it had exploded it would have wiped Russia off the face of the globe and likely thrown us off our axis. They are keeping close watch on them and will be of assistance if we request it in time. They also made a dud of one of ours. Too powerful. This last has not been given out. Soldek showed in conversation that he had learned English well. He could use it perfectly and could express himself with many less words than we can. Dick timed himself with his wrist watch and was on the Saucer for thirteen hours. This explodes the assumption that one cannot have any metal on him. He also had silver money in his pocket.

Soldek told him a number of things but requested they be not repeated. Consequently we do not know what further info was given. Dick asked him whether he could communicate with his friends who would be waiting below somewhere and who, upon seeing his car would be worried and might call Police if he did not let them know. Soldek hesitated and then went over to the others who had not entered into the picture. They all went into a huddle and after some

Harry M. Gesner

4815 TOPEKA DRIVE
TARZANA, CALIFORNIA

conversation agreed. He told Dick to remain seated while he tuned in. It took fifteen minutes to adjust the ray. But before making contact with his friends Soldek said or asked him if he would like to see what another Planet looked like close up. He tuned in another panel and a scene or what appeared to be a base ball was shown. This enlarged rapidly to the size of a Basket ball and there was a Planet with oceans continents Mtns etc. But not quite large enough to see the cities. Rivers were shown also. After giving him a good look he turned it off. By this time the other was ready and there on the screen was his friends car with his friends seated facing each other with a set up for Beam and a tape. He could see right thru the roof of the car and seemingly looked at the top of their heads. Soldek said go ahead and talk. Dick asked where the Mike was. S. replied that all he had to do was talk. Dick did not note that there was a ribbon of metallic material hanging from the desk. He then spoke to the fellows calling them by name and stating he was out in space above them. They replied that he should stop his kidding. To verify it Dick told each one, how he was dressed. This seemed to amaze them, from their remarks and expressions. Soldek then added several remarks in a rather serious tone, about more harmony among the group and less jealousy because Dick had been selected by him.

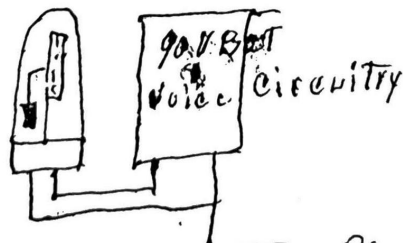

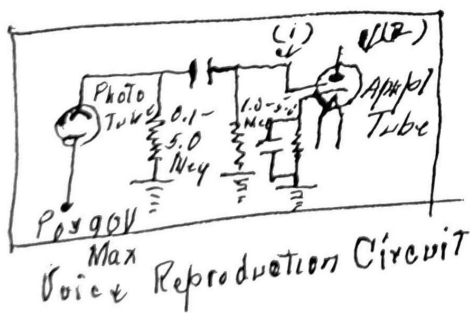

Dick was then told by Soldek that the contact was over. They dropped toward the earth and landed or hovered in the same spot. Dick bid them goodbye, thanked them and the contact was over for good. No more have been made.

During the entire thirteen hours in the ship he had no desire for food or drink and no inclination for bodily functions. After his arrival he did. The ship took off vertically and in a horizontal position. Absolutely no sense of motion going either up or down. I neglected to state that the portholes in the side of the craft seemed to be either black glass or coated black. Metal shell conformed to the regular bluish steel color. In getting up from the table or desk his foot caught in the metallic ribbon and tore it loose. Soldek was quite perturbed for a bit but two of the crew came in at once and repaired it. It had two or three wires connected to it.

I hope you find this worth reading. Am not so hot as a writer.

Don't forget the Hookup. Trans.

Harry

Amplifier may be hearing aid. Port Radio or Recorder. Phones or speaker

Unit can be attached to a Tekscope so that light beam can be picked up out in space or used by orienting the Photo cell alone.

June 12, 1955

Dear David,

I am much interested in your activities, particularly with respect to the light modulated systems. I think that the tubes you have for the photoelectric work are as good as any and a fair representation. Please let me know about your experimental efforts.

With regard to the ferrite cores, I can't tell you very much beyond that which you already know. The formula which I gave you is based on the fact that ALL fields become established through Hertzian waves, and although we usually consider that fields contain energy, they really are only indicators of the RELATIVE energy level existing with reference to the space or material about which the field is to be found. When electrons are accelerated their relative energy levels are changed, and the indicators of this condition move into position as Hertzian waves. The fields within ferrite are due to changing energy levels of atoms with singular spins. These are reoriented as a result and in response to, the field(indicators) of the accelerated electrons in the wire. This means that the singular spins are rotated, which in turn produce more fields (indicators) which in turn induce further rotation. The net result of all this is that a sequence of spin re-alignments takes place within the ferrite which moves through the ferrite with a velocity equal to the velocity of light in free space, divided by the square root of the product of the effective permeability and dielectric constant. These last two quantities are not quite what we have been taught but our ideas are close enough to be useful. Now, the wave progressing through the ferrite must travel at the same velocity as the inducing wave in the surrounding wire, hence the formula. However, as the singular spins are rotated into new positions they obey perfectly normal vectorial laws, in three space and three field dimensions, and in so doing generate doughnut-shaped waves which comprise of closed electric, closed magnetic and closed but linked tempic fields. They are literally pushed out the far end of the ferrite core and sent merrily on their way. Since they involve extremely small mass they are easily directed, and since their rate of assimilation can be exactly the same as the rate of generation, (within a region having substantially the same tempic field) they can be tuned in by any receiver which has a closed circuit input. I hope this explanation is adequate.

With respect to the cores which you have, I would suggest that you use many turns of smaller wire as the relative velocity within should be of the order of 0.01

Many thanks for the catalogue. It just arrived and I havn't yet had time to check it against mine, is of Canadian origin dealing with ferrites made in

Some time ago we tried radio contact with the saucer people on 19,940 kc, but without much luck. Apparently they could hear us sweeping by their receiver setting, and we could hear a powerful station sweeping erratically across 19,940 but we couldn't tune it in. They said that it was due to the unstable nature of the earth's tempic field. If this is the case, then the doughnut waves should be the clear thing for communicating with them. They say that is what they use.

I haven't yet been able to check on the 10.8 mc. but expect to do so shortly. I am in charge of all the monitoring service in Canada so it shouldn't be too hard to get some of the boys to have a listen.

You may recall a report about 8 months ago about a saucer crash landing in Heligoland, and taken by the Norwegians. Affa says that is one of his ships and it is possible that the British may eventually have got their hands on it. I think that there are several in earth peoples hands, but I am afraid that they won't learn much about them from inspection; about as much as a Hotentot would learn about one of our aircraft. One must go to kindergarten before one goes to college.

As far as Canada is concerned, they have no program regarding UFO's now, except to sit tight and see what happens. AVRO's project is simply a circular airfoil craft, and that job in LOOK was just a designer's dream, probably after a hard night.

With reference to employment in Canada, I am not too sure of the conditions but I do know that only Canadians work in the civil service, although naturalization is a simple process. However, I shall try to gather together some bulletins and send them to you, which will give you facts.

I have available a Tapewriter tape machine which runs at slow speed, I think $3\frac{1}{2}$ inches per second. If you wish I shall prepare a tape on what I know about this time field business, and send it along. I imagine that Williamson might also be interested.

I am rebuilding my gravimeter, hoping to gain beter instrument stability, for the purpose of checking for time scale changes. One of our group Dr. D.F. Stedman has built a comparison spectrograph with recorder, for the same purpose. His idea is that the angle of diffraction in prisms and gratings will alter with time field changes. I feel that since gravity is directly a time field phenomenon. the gravimeter should show it. I also propose a direct measurement of the time taken for a pulse to travel a certain distance. If you are interested in this aspect I shall tell you more later.

As ever

M. Kent

W5CA Tijeras New Mexico.

W. B. Smith,
Box 51
City View Post Office,
Onatario.

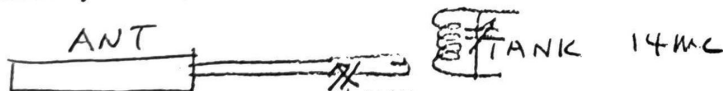

Dear Wilbert.

I was glad to have your May 25th letter. Sorry that we did not get to IRE meeting together. I was there.

I have been in tape contact with G.H. Williamson of Prescott and only yesterday received an hour tape from Ric. He is more than anxious to hear fully from you. I am working with his project as electronics engineer, working from Tijeras as I am still at Sandia. Dick Miller, the engineer with Telonic, is no longer with them so I will carry on with the help of a Prescott ham who will carry out the plans drawn here at W5CA. Ric is very much interested in the antenna and will be glad to get anything you can furnish him. I suggest that you send me any electronic information as I will advise him on that score and if you sent it direct to him, he would only refer it back to me. Telonic is desirous of putting in a 6 inch reflector scope with infra- and ultra- light receivers, and they are currently building this scope there. If you have ANY information concerning this type of receiver device, tube types etc, I would appreciate it. Today I secured the promise of a pair of CE 705A2s, that are operative in the higher Angstrom unit field, and they have an output of about 540 ~~millivolts~~ millivolts at the standard input, with a resistance of from 150 to 600 K ohms. They are the Cetron lead sulfide type. Question-- are these as good as we can get? They are about 1/4 inch in diameter.. They will fit nicely into the eye piece of the scope.

Ric said they had an ~~LP40~~ LP40 RCA infra red tube and also a LP28 ultra violet tube on hand.. What is the comparison, if you know.

Re the antenna.. I have worked many USA stations while using it on transmit. I used the 14 mc CW band and have received reports of 1 to 2 S units less than my long wire.. My long wire is DOWN so know it is not radiating.. I have worked maybe 25 stations while I used this, in just the shape you sent it. I have it hooked like this.

The variable in link line is to detune as no ~~swinging~~ swinging link here at present.

I am now in possession of TWO ferrite cores. They are marked C 1305B- and are .620 X 8 ". They have a Blue-RED stripe on them. I do NOT know their manufacturer's name, altho I am going to try to get it. They are solid, not tubing. I am going to wind them with about #16 wire, Formax covered, exactly alike. Then I am going to try to use one as receiver and one on transmitter, with very low power on transmitter, and see what I get on receive.. I will probably use a few MW power on the transmitter, completely enclosed in a shield except for the antenna.

2... You enclosed the colored schetch of the antenna but I am at loss to know about the formula. Please enlighten me as to the meaning of all symbols you use in the future as we must keep our nomenclature straight.

You gave me $\frac{P}{d}$ equals $\frac{\pi}{\sqrt{\mu K}}$

P is pitch
d is diameter

π is pi, of course
is μ permeability of the core material??
Is it permeability initial??
or is it permeability maximum differential??
and what is k-- the dielectric constant of the core???

please inform me-- or give me more dope///

I requested a friend to send you Crowley's Catalogue #54, covering Magnetic Components for HF application.. A Mr. George Ellis of ~~AMENEX~~ Aerovox Pacific Coast Division represents them and sent me a copy of this most excellent catalogue containing many types of information concerning cores, and I immediately thought of you as your letter arrived in same mail.. I have written him for samples of his CR20 Antenna cores-- R 3299 (.620 X 10.5") and R 3081 (.937 X 8").. and prices of same.. These are found on page 101.. Data on CR 20 is on 99-102. I have a copy of the catalogue here so you can refer to it by page etc in replying. I hope that this will be of some service to you. Will you please tell me the manufacturer and TYPE of cores you want. Perhaps I can secure some here, as I have some rather interesting contacts in the USA.

I gather that the antenna WILL be poor for electromagnetic operation if it is any good for OS use.

I plan to experieiment with these two cores I have here in various ways and would appreciate any information-- as soon as possible-- that would help me.

I have NOT had any OS contacts. I have sent CQ on ~~2001~~ 14002 KC CW-- always the same exact ffrequency-- for hours on end-- just in the hope.. I have not heard anything unusual.

I hear from Williamson re a mysterious signal reported from OS on 10.8 MC. I hear it here. A wierd sort of modulation unlike anything I ever heard of before.. It is sort of a pulsed type of modulation sort of like LORAN.. I have no way to DF it. But I am told that is is reported to be from "straight up". Any information there??

I also have reports of a strange type of CW signal eminating from an area called Montezuma Castle in central Arizona, just south of Oak Creek canyon. It is reported loud when within a few miles and, dying out papidly.. No intelligence on the carrier..

March 13, 1958

Dear Mrs. Campbell,-

I was very pleased to hear from you by telephone and then to receive your very substantial letter setting out your views on many things of mutual interest.

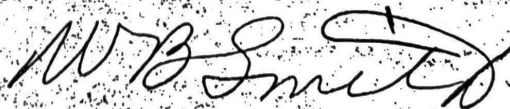

I hope Major Keyhoe will find the little article of sufficient interest to publish as I am sure that it carries a story which will mean something to someone. There is a great deal more that I would like to publish but the boys from topside say no, not at present. Apparently, the need of the moment is to appreciate the great truth of the relationship of man to the Universe; technical details and design data on space ships can come later when we are more civilized.

I am aware of the work which Mr. Pelley is doing and have some little knowledge of how it fits into the scheme of things. I have never met him personally but I hope to do so some time. Apparently, we have quite a few friends in common, in more ways than one.

I am naturally most interested in the transcendental television, although I know nothing about it. But with the array of talent available they should get it working. I am sure it will have quite an impact on our way of life, and there will probably be an old time "withh Hunt" as a result.

I am afraid that my western trip is going to be mostly work as I have a lot of ground to cover and a short time to do it in. I shall be back in Ottawa about the end of the month. Meanwhile, if anything should come up, my wife will be here and she has been with me through all our studies and work.

With best personal regards

A handwritten signature in cursive script, appearing to read 'W. B. Smith', written in dark ink.

W. B. Smith

Mrs. Duncan Cameron Campbell

8615 Brandt Place
Bethesda 14, Maryland
Phone OLiver 2-2136

Sunday, March 9, 1958

Dear Mr. and Mrs. Smith,

Thank you for your gracious conversation earlier today when I called you on matters of such importance in our mutual researches. I deeply appreciate it, for my sense of urgency in getting acquainted with you is very great—sufficient to overcome the natural hesitancy.

There is much longing in my heart to know more complete answers to the enigma of life and the purpose of our sojourns on this plane. For years I have done extensive reading along psychical research lines and have found out many things that fit together in the mosaic of truth. . . . This isn't the time to acquaint you with any details to speak of—but when I tell you that Mr. Campbell took his own life last June out of extensive fears of saucer contacts, etc, you will understand my situation more fully. Mr. Hackett had passed on some years ago, after a fine life as a missionary school principal — he was the lifetime companion and father of our three children, now grown and successfully started in their various professions — and Mr. Campbell had decided at a "saucer meeting" that he and I should work together on our mutual interests in UFOs and spiritual research. We were married about 100 days and his action was and still is a profound mystery to me. The enclosed pamphlet on "Truth and Flying Saucers" was written a few weeks before he ended a long life of varied interests. . . .

The booklet on Soulcraft, also enclosed, is the promised item about Mr. William D. Pelley. I visited Mr. and Mrs. Pelley at Christmastime and saw his TV machine which he has invented to serve as a mechanical medium, but I did not see a successful demonstration of it while there. It had just blown another tube and I saw evidence of that; also I listened to many hours of tape recordings of conversations purportedly by Edison, Benjamin Franklin, Henry Ford and others who told Mr. Pelley and his engineers through seances precisely how to build this machine. I have been told on the telephone and in letters that a successful demonstration was effected on January 16 last, and that patents are taken out, companies formed, sets to be delivered "by early summer, we believe"—so this amazing development may be something you'll wish to look into when you take your trip west. Or perhaps you will prefer to correspond. There are Soulcraft magazines that give much information about this man's decades of hard work.

The page is nearly filled — but of course there is much yet to be written or said. I feel you will understand and forgive me for my unusual burst of confidence. I have not written the above news before to anyone, though my family and friends here know about it. Mr. Campbell was a government man (FHA) for thirty-eight years; no family of his own; eccentric but very fine.

This you need not answer unless the Spirit directs, for I know how busy you are. God bless you for your own researches and for your courage to tell somewhat about them. If Major Keyhoe does not use your piece, I urge you to publish it elsewhere. Actually, I know NICAP members would buy single issues by the thousands—just to obtain this piece—for I read the letters and I know the trend of thinking in these matters. . . .

As workers together with Christ
Rose Hackett-Campbell

October 27, 1958

Dear Mr. Rideout,

I read your letter of October 23 with appreciation and some amusement. It is quite apparent that my comments on time as a field function did not ring a bell. I am well aware that regarding time as a variable places modern science in the untenable position of trying to lift itself by its bootstraps; but I can only say that these are not my ideas but originate with those to whom our science resembles medieval superstition. I do not understand them fully and I have much to learn, but I have mastered a few basic principles and of these I am sure.

Time as a field function is NOT the same function as registered by our clocks, which record the changing entropy of a system, but is the function which makes this happen.

There is only ONE reality in our universe, and that is the concept of SPIN, and from this derive twelve dimensions. Twelve dimensions are necessary and sufficient to express our universe in its entirety.

Dimensions must include as well as their vector direction, the component of reality in that direction for without the reality there would be no dimension.

Dimensions are arranged in four fabrics of three each, linked by a "quadrature concept". This is the concept that Relativity strives for by introducing $\sqrt{-1}$ between the space and time axis.

The concept of "force" is a fiction which we invented to stultify our thinking. It is merely a cover-up for our lack of understanding of the interaction of reality.

The foregoing will probably sound most sacreligious to the ears of orthodoxy, but I don't mind in the least if these ideas are not immediately subscribed to. Science has a long and lurid history of reluctance to accept ideas which subsequently proved to be of great value.

We are progressing quite well in our gravity research and ran our unit for the first time on Oct. 26. The effect was measured on a precision chemical balance, when a brass weight increased from 24.4623 grams to 24.4628 grams when the active material (1 cubic inch of aluminum) was 10 inches directly under the weight. Needless to say we have much yet to do and as soon as we have some relationships established we will prepare a suitable paper, a copy of which I shall send to you if you are interested.

Meanwhile, don't be upset about the above unorthodox ideas; they either click or don't click, and I am quite satisfied that we will all come to them sooner or later.

Best regards

Mr. W. B. Smith
10 Lotta Avenue, City View
Ottawa 5, Ontario
Canada

Dear Mr. Smith:

It certainly was a pleasure to have you here for Gravity Day. Thank you for your nice letter about the program. I am glad you had a chance to meet Mr. Fisher and Professor Hooper.

You asked us to put you in touch with others who may be active in the field opened up by Fisher and Hooper. We don't know of anybody at the present time but will remember your request if such a person or persons come to our attention.

You also asked us to make any comments on your studies. This we are glad to do even though you may not agree with what we say. Our scientists have been studying the three pages of your "Comments on the Fisher-Hooper Effect". They have reported to me as follows:

"The first difficulty with the paper is the definition of time intensity, or tempic field intensity. The definition is a circular definition and gets nowhere.

Time is measured by any repetitive phenomenon such as the frequency of radiation from an excited atom. This frequency does not change under widely varying physical conditions except for a slight but detectable change in white dwarf stars.

It is difficult to picture a "time field" because fields imply attraction or repulsion of something in the field. What can time attract or repel?

Mr. W. B. Smith - continued

As I recall the description of the action of the Worden-type gravimeter is due to the quartz-fibre torsion balance.

Is it not true that tensile strength is due to many other factors than binding forces?"

Sincerely,

G. M. Rideout

President

February 11, 1958

Dear Mr. Burridge.

Please let me put you straight with respect to that coil. The information leading up to its construction came from "topside", and therefore I feel that I have absolutely no property rights to it, and I would be most pleased if data on it could be published to an extent which would preclude future patentability.

I have good reason to believe that the real significance of the coil WILL NOT BE KNOWN until we are civilized enough to use it properly. I certainly shall not go out of my way to present such a thing to a belligerent bunch of characters as would gobble onto it even if I did have the whole story, which I haven't. Dave Middleton knows as much about the coil as I propose to tell anyone at this time.

I do not care one way or the other whether or not I am identified with the coil; but if I am I would prefer to be merely the intermediary by whom the design was received.

Thank you very much for your reference of Mr. Mennie, in Windsor. I very seldom get to Windsor as it is about 6 or 7 hundred miles from here and I don't have much excuse to go there, although I have several names and addresses in the adjoining city of Detroit and some of these days I shall make a trip down there and do one big job of looking people up.

I am most interested in "anti gravity" devices, and would welcome ANY information I can get on the subject. I know of the Gravity Research Foundation. I am also acquainted with the B.S.R.A. group, Mark Probert, et al. Also, the De La-Warr Laboratories.

Best regards

W. B. Smith

Mr. W. B. Smith
10 Lotta, P. O. Box 51,
Cityview, Ontario,
Canada.

Dear Mr. Smith:

Thank you for your letter of February 3rd., and for the information it contained re. your coil. I believe I understand your position concerning the coil and its potential.

Though you did not care to answer my questions concerning the coil, neither did you raise any objections to my publishing whatever I felt best to concerning it, or those results I might obtain relative to its use from experiments I might make with it, or obtain from others who might have experimented with it. If you do have any such objections, I hope you will be specific in your reply.

The reason I asked particularly about the Patentability of the coil was that - in this country, at least - if certain information regarding a matter is published in a general circulation medium before the patent is granted, no patent can ever be granted on it. I did not wish to be so responsible should you have decided to patent the coil.

Neither did you make it clear, whether or not, in any published material concerning the coil, you wished to be identified with it?

I do not know how far your home may be from Windsor, but at Windsor, lives - or did so - a Mr. E. W. Mennie, at 979 Windson Ave., Windsor, Ontario. He is interested, I believe, in some of the same things you are, and you might find it interesting to contact him, should ~~be~~ you be close enough. Mr. Mennie appears to know something of a man named Henderson, who used to be with the old Winton engine Co., and who had done something toward the development of a device developing "free energy".

Are you at all interested in "anti-gravitic" devices? If so, do you know about the Gravity Research Foundation, New Boston, New Hampshire? If not, a note to them will bring you information which may interest you.

Do you happen to know of the Borderline^{Science} Research Associates,
at 3524 Adams Ave, San Diego 16, Calif? If not, a request for

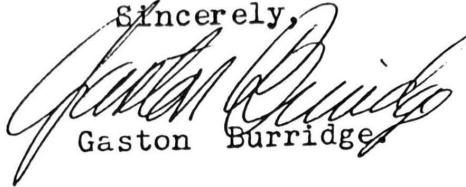

2.

a sample copy of their bi-monthly publication, Round Robin might interest you.

I suppose you of the De La Waar Laboratories, Raleigh Park Road, Oxford, England, and their quarterly, "Mind and Matter"? If not, this might prove an interesting contact.

Thank you for your interest and courtsey.

Sincerely,

A handwritten signature in cursive script, appearing to read "Gaston Burridge".

Gaston Burridge

TOP SECRET

Mr. Edwards should write to the Dept of National defence Ottawa requesting that clearance may be obtained for Mr. W. B. Smith to visit the appropriate Service in the United States to discuss the use of Terrestrial magnetic forces in relation to ~~XXXX~~airodynamic problems associated with saucer shaped objects .

In the covering request, the Department of transport should relate in as much detail as possible the objects of this study and also detail the work which has been carried out in the Geophysical field in Canada

Information unofficially obtained from Dr. Robert I Sarbacher , dean of the Graduate school, Georgia University

214 Kent Road, Wellington
Alexandria, Va.
July 27, 1952

Mr. Wilbur B. Smith,
Department of Transport,
Ottawa, Canada.

Dear Mr. Smith:

Please accept my apology for the long delay in thanking you for the Ottawa paper, which gave the opinions of various Canadian authorities as regards to the flying saucers. I had expected you to be down this way, and I meant to thank you then.

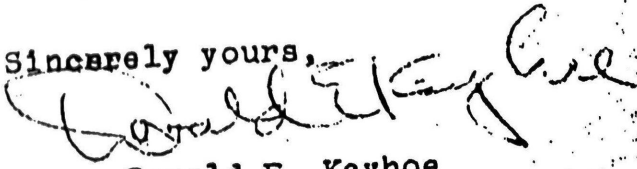

Undoubtedly, you have noticed the sudden flurry in saucer activity, bearing out your predictions earlier this year. I have been talking with the Air Force, in regard to another article, and their attitude has definitely changed. My opinion is that they just don't know the full answer, and that they're worried about all the recent sightings.

Have you heard of any new developments? Mr. Purdy, at TRUE, was wondering how you're coming along with your experiments, and if there is anything likely to be released which would make a story for us.

I had a talk recently with Mr. Arthur Clarke, who as you know is head of the British Interplanetary Society. He made a tour of the U.S., visited White Sands, Palomar and other spots. He is now convinced the saucers are real -- he was skeptical for a while -- but he didn't have any dramatically new facts. He said that Palomar men told him they hadn't photographed any saucers, as rumored, but one was sighted near there -- and by coincidence, apparently, some of the telescope operating mechanism went wrong at the same moment. There was a recent sighting at White Sands, tracked by two theodolite which may give some new data, if the Air Force will release it. But still no startling details.

If you plan to be down this way soon, please let me know. Perhaps by that time I'll have found something of interest, in my Air Force talks.

Sincerely yours,

Donald E. Keyhoe

Mr. Edward S. Schultz
450 Colvin Ave.
Buffalo, N.Y.

Dear Mr. Schultz,

I hope that you will pardon my answering your letter of February 3, on a personal basis. Frankly, my associates do not consider that most of the material which you were good enough to send contributes very much to our study of the saucer phenomenon. However, I feel that the trouble is more likely in presentation than subject matter, and I feel that there is probably much more there than we are getting out of it.

Our group consists of scientists and engineers in several different fields. Several of them are considered to be authorities in their own lines, and we have all had a thorough training in what are considered to be the basic principles of physics and mathematics. We have no reason to doubt the validity of these principles, although we are the first to admit that they may be quite inadequate to express more than a very small portion of our universe.

Our difficulty is that we are unable to find specific common ground between what your group is offering and what we are used to working with. As you know, our modern science is predicated almost entirely on equations, which are handled by mathematical manipulations which were developed by the application of the most rigid logic. What we require therefore, is something which we can link to our equations. Failing that, we require some other formal pattern of logic which is self consistent, into which we can fit your material, and from which we may derive conclusions amenable to experimental confirmation. We do not consider the mere authoritative statement of something to constitute a fact, but ask, rather that we be shown how to confirm the fact for ourselves, if we are so minded. As you no doubt appreciate, in modern science all facts are equally available for confirmation by any careful experimenter who has the necessary equipment available, and are not restricted to a favored few who may be peculiarly constituted to explore them.

Several members of our group, including myself, have investigated psychical phenomena of various types and are familiar with the peculiar conditions which surround this subject. We feel, nevertheless, that scientific methods can be used in this field with good success, and we have used these methods ourselves to advantage.

In general, it is my own wish to glean the maximum knowledge from the material which your group have so generously provided, but in order to do this, I am afraid I shall have to request some kind of translation into the language of the science with which I am familiar. If I may be permitted to ask a few questions, you might be able to obtain answers which will provide the necessary clues for us to work with.

One question which is bothering us considerably is that of energy and momentum levels. We are aware that so far as our material universe is concerned at least, the laws of conservation of energy and momentum, and mass equivalents are inviolate. If, however, these laws are merely extensions of some law of wider scope we would like to know about it, and the circumstances under which it reduces to the laws with which we are familiar.

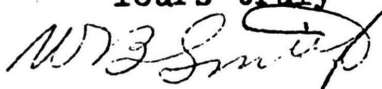

We frequently encounter references to "planes of vibration" which, frankly, don't mean very much to us. What is vibrating? What degrees of freedom has it? What directions are involved in the vibrations? What mathematical expression will describe this vibration? What numerical values are associated with the vibration? Movement of any kind in the material universe is always accompanied by fields of various sorts; what fields are associated with these vibrations?

We know of no experiment where particles have appeared without the absorption of an equivalent amount of energy, nor do we know of any means whereby particles can vanish without manifesting exactly equivalent energy. Surely, if anything the size of an ether ship could appear or disappear, there must be tremendous energies involved. Where, then lies this energy?

In your descriptions of the ether worlds there is no description of the precise organization of the basis substance to form the reality of those worlds. Unless our concepts of reality are very much at fault, SOME type of organization is necessary. We would like to know on what principles this is based.

The foregoing is based on an honest desire on our part to get to the bottom of this interesting subject, and is not intended to be in any way critical of the work which your group obviously have done on this matter. We would appreciate it very much if you could attempt answers to the above questions, and possibly many more which will occur to us from time to time. I sincerely hope that you will appreciate why this letter is being sent unofficially, since our terms of reference are rather specific as to the lines of investigation which we may follow.

Yours truly

W. B. Smith
