| 10. BRIEF SUMMARY OF SIGHTING<br>A star-like object, blue to firey brown in color, looked to be longer than its width with a tail the size of the object. |  |                                                                                                                                                                                                       |  | 11. COMMENTS<br>When small objects like a star are observed through binoculars they appear to move or to be distorted. Duration and movement indicates astronomical sighting without positional info the object cannot be identified. Characteristics, however, of sighting are present and case is evaluated on this basis.                                                                                                                                                                                                                                                                           |  |
