Wright-Patterson AFB, Ohio

The undersigned was pilot in a T-33 aircraft flying at 35,000 feet altitude (indicated) on a magnetic heading of 230° on radial 111 from Kansas City VOR at 2121 EST, 9 September 1960, approximately 60 miles east of Kansas City, and observed the following:

A brilliant "shooting star" phenomenon occurred with a beginning burn trace approximately 80° above the horizontal from the level of my eye. The burn trace increased in intensity to final burn-out on approximately the eye level of the undersigned. The trajectory appeared nearly vertical and directly over the nose of the aircraft. The most unusual aspects of the phenomenon were the vertical trajectory and the pure white intensity of the final burn-out, which approached that of a magnesium flare.
